News Release

Water Quality Monitoring Sample Results

November 23, 2021 – Iqaluit, Nunavut

The City has received and is releasing the latest results of the ongoing water quality monitoring. These results cover test results from the weekly sampling program taken between November 7th 2021 and November 15th, 2021.

The City is testing for BTEX/PHC[F1-F4], which tests for Petroleum Hydrocarbons in the water using 11 different parameters.

Samples are taken from six different locations within the water treatment plant and seven locations throughout the water distribution system. The sample points from the water distribution system are spread across Iqaluit, to provide an all-encompassing assessment of the water quality.

The sample results have all been returned with a non-detect result for petroleum hydrocarbons at all sample points in the water treatment plant and the distribution system.

The City will continue to release results as they are available.

The current Do Not Consume Order, issued by the Government of Nunavut's Department of Public Health on October 12, 2021, remains in place.
